The **Harvest Yield Analytics (HYA)** model captures real-time yield results from commercial seed company trial results during the fall harvest season. Yields from seed plot trials are then compared to historical seed plot trials (2020–2024) in the same region and used as a predictor for average county yields. It's important to note these results are not fully representative of every acre or growing condition, but they provide valuable directional insights into harvest outcomes.

HYA's latest composite, now covering over 62% of corn counties, shows yields running +2.1 bu/ac above 2024, with mixed regional trends emerging as harvest advances. South Dakota (+24.6), North Dakota (+22.7), and Ohio (+15.9) lead year-over-year gains, while Kansas (-16.6), Iowa (-7.7), and Illinois (-7.4) remain notably weaker. The latest data suggest continued strength in the Northern Plains and eastern Corn Belt, offsetting declines across the central core. With more than half the crop now cut, HYA indicates national yields are stabilizing, though the Midwest deficit still caps upside to USDA's 186.7 bu/ac forecast.
